

AI PROMPTS FOR “CWSA - PROXIMITY SEARCH”

Aryaman A 

(This document contains the prompts used for code generation, the methods used — as claimed by AI — and some general comments in place of the actual file versions)

Software Used

I used the following freely available models:

- *ChatGPT Classic* [Version 1.2026.184 (1784145287)] - Auto mode, around v_5.6
- *Claude* - Sonnet 14

Introduction

Below are the genuine copies of the prompts I gave to several AI models, including ChatGPT, Claude and Gemini. The text is copy pasted from my history with the AI bots. Rather than explicitly pasting the code, or providing the files for the program at each stage, I have attached some personal comments wherever helpful. Also, I have skipped some redundant prompts.

DISCLAIMER

There are multiple typos and grammatical errors as well as unclear/illogical requirements in the prompts I have given AI. These are the result of haste and carelessness. I have reproduced the prompts exactly as I gave them so as to remain faithful to the exact machine processes that were undertaken for the generation, modification and optimisation of the program. These are presented to clarify the process behind code generation and are by no means a guideline or an ideal manner of going about the process.

Prompts

We begin by asking ChatGPT to generate code to meet our requirements:

Prompt Alpha

“I have a complete collection of Sri Aurobindo's collected works - stored as PDFs. [Note: there are some other index files in the folders]. Write a highly efficient PYTHON program that takes for input this folder's location and allows me to perform a PROXIMITY SEARCH (This should allow me to include words I am looking for in a search range (number of words within which my inputted words have to figure)). See if you can make a neat GUI that allows me to readily input these words as well as easily see the results: [preferably as follows: the GUI highlights where the result figures and a click on these expands the result and highlights the actual lines (from the original text)]. I want to see clearly and easily.

No errors whatsoever in the program. Go through your output, revise heavily, make any corrections possible. Highest priority to efficiency and UI. Absolutely no room for improvement should be there.

{GIVE EXCELLENT CODE FOR USE IN VSCODE IMMEDIATELY} - use whatever library you want, just lemming what you are using. I want a neat GUI for input and output. No errors and no glitches, bugs, etc.). Should be neat, clean, and easily usable and optimised.”

Prompt 2

“Ok. UI is quite poor. Text is not coming in black, or at least I am unable to see what I type. Next, I am being asked to open a file or folder, I am not sure. The UI looks very unprofessional and is ugly. Improve on those, and make the input as follow:

Neat entry box to enter words. Separate box to enter word gap (put instructions above so user understands what is to be done.) make it very user friendly. Also, I think it will be difficult for you to suit my needs without the filenames and folder name. After you confirm, I will share the complete path names and a screenshot of the folder contents with the filenames (you know the parent and can figure out the full name I suppose). Make these the root file. Next, optimise your algorithm for maximal efficiency. Absolutely no error, no mistake and no extra time wastage. Make the UI neater, tighter, cleaner, more aesthetic and warmer.

Another key point:

In Letters on Yoga, letters are separated by 3 stars (***) typically or something of this sort. You must not give results from different letters (as in do not output a result if the hit is from different letters). The same for chapters in other books and Cantos in Savitri. You decide accordingly on divisions such as BOOKS, CANTOS, VERSES, POETRY, ETC. Make a neat and clean output remember. And confirm if you will take the filenames.”

Next, I attach an image of my folder’s contents and type in the folder’s complete pathname, so that ChatGPT can readily use these to the program.

Prompt 3

“'/Users/aryamananand/Desktop/MISC/Collected Works of Sri Aurobindo'

Remember: No errors. High efficiency. Clean code. User Friendly GUI.”

At this point, I don’t quite remember why, I started a new chat with ChatGPT. I suppose it was to clear any useless (or at least so I thought) memory that came from the previous prompts.

Nonetheless, I showed it an image of the GUI and prompted:

Prompt 4

“You wrote some code:

[I pasted the code here]

But the results are too spaced out. Make them more next to each other and thus readable. Please improve this and make the clicking easier. Make the whole thing neater. Also, any idea how to improve the output? Make it better.”

ChatGPT gave me a patchwork of edits, and I had no intention of doing the editing manually. I therefore requested it:

Prompt 5

“Give the whole copy passable code. Neat. Highly efficient. No error, lag, formatting issues.”

An error came up in this program, so I sent a screenshot of it to ChatGPT and stated the obvious:

Prompt 6

This error is coming.

By this time, ChatGPT was making some constant error and the program was crashing, or not displaying (in the GUI) the correct results. Therefore, I shifted over to Claude.

Here’s my first prompt to Claude after pasting ChatGPT’s latest version:

Prompt 7

“So I have this code. Want to improve it. Need it to:

- Run faster
- Give neater, more formatted results
- Make the UI more friendly
- Use Apple-friendly fonts.
- Be highly optimised and efficient for minimal time delay

Be clean, near

Output the final, corrected, accurate, bettered and more powerful version of this. see if you can make a beautiful GUI.”

Some errors were coming up and therefore:

Prompt 8

“Need to make this work and improve the overall GUI. Please see if you can once and for all make a neat system. Neat formatted outputs (keep it in regular font), clean UI, easy to use. And for multiple devices (local - windows, linux, mac). make it something beautiful. improve the efficiency of the program and make it look good.”

Errors still persisted and I wanted to add a filtering option so as to allow users to search through any particular file:

Prompt 9

“here's an error. also, if i search for something, do NOT print the previous unit (in the large preview display). just this unit. (previous para is fine). make it neater, format the output better. also add a feature to filter (by selecting specific PDFs). anything else interesting you think will help to filter results also add. make sure it works, no error, accurate, precise. check the code before outputting it. excellent work otherwise.”

My Claude limit was reached and I had to switch back to ChatGPT. Also, it was around now that I understood that the “proximity search” was looking for the distance between words, and not at the range of words. Also, the word order was strictly followed. I had to request ChatGPT again. A couple of prompts down the line:

Prompt 10

Ok so tested code. Excellent work. Now see if you can amend errors like this: if you can see the first words of the result are dulled, grey. Give it in proper format. And is there anyway you can give page number on the pdf??. Lemming and try to optimise and clean up the code as well.

And then:

Prompt 11

Yes alright. See if you can output the page number that figures in the PDF. This makes it much easier (if you succeed, remove the other page number. Ok, give me the updated code then. Also, the buttons to increase the word are very unprofessional, make them look neater and cleaner and undersnatanble. Excellent work otherwise, see if you can give in times new roman font (for the preview) - deicde if it will look good or bad. One last thing: if somehow possible, see if you can include a line below the result containing the "chapter name", "poem name", canto name, letter date, or any such useful information. Incorporate all of this as neatly and correctly as possible. No errors. Check well. Give me the entire code.

Again:

Prompt 12

Do the corrections. Go ahead. No errors this time please. It takes time to get it from you and run.

Prompt 13

This is returning no results?

Then, the next day, I shifted to Claude:

Prompt 14

Need to make this work and improve the overall GUI. Please see if you can once and for all make a neat system. Neat formatted outputs (keep it in regular font), clean UI, easy to use. And for multiple devices (local - windows, linux, mac). make it something beautiful. improve the efficiency of the program and make it look good.

And:

Prompt 15

here's an error. also, if i search for something, do NOT print the previous unit (in the large preview display). just this unit. (previous para is fine). make it neater, format the output better. also add a feature to filter (by selecting specific PDFs). anything else interesting you think will help to filter results also add. make sure it works, no error, accurate, precise. check the code before outputting it. excellent work otherwise.

And lastly back to ChatGPT: (for the “polishing” and, in a way, less demanding work)

Prompt 16

I have this file. some "start" error is coming (says atStart). check. also, I want this program to output results that NEED NOT contain the words in the order inputted. basically, no matter what I enter, the words entered should be there in ANY order. [you can ask the user to separate distinct words by commas and keep phrases in between these - and you can search so that the phrase words are in the order specified while the comma separated phrases or words can be in any order] remove all errors. Improve the overall thing, but no errors. keep structure otherwise same.

This following prompt was a major change: all this time the program was looking at the words between our search-words. But we did not want that. We wanted to search a *range of words*. I therefore asked ChatGPT to introduce that major change and it did a fairly well job, surprisingly in the first attempt. Perhaps, I reflect now, it is not really the algorithm that AI struggles to deal with, but rather the program architecture, with which it is inconsistent, unsure (that is, of course, partly my mistake, I really gave it no guidelines, not that I could have, on *how* to setup, organise and design the program). Nonetheless, here is my *IMPORTANT* prompt:

Prompt 17

code doing well. only one small thing. by word gap, I dont mean gap between the words. I am referring to: IN A RANGE OF [word gap] words, do these [entered words] figure?

Now there was some error persisting, and there wasn't any real improvement, so I had to give a prompt again:

Prompt 18

still says word gap. also, modify this properly (and see if you can add a filter to search a specific file). no error. accurate, precise. efficient, optimised, perfect code.

The following is yet another IMPORTANT change. Apparently, to my surprise, the program was not conducting the search over lines, again partly my mistake, when I, in one of the prompts above mistakenly asked it to skip those - or at least so AI understood.

Prompt 19

one question: if the words are in different lines, you still output right? I meant to say don't output if it is a different letter. that is all. if it is a different page, but continuation of the same chapter, letter, poem, etc. PLEASE OUTPUT IT.

Prompt 20

I searched for "heart, dumb, life". it said no results. but actually in Savitri there are instances (I have other programs that gave valid outputs). check this. also, "Author's note" became "Author's Note". solve this too. please make sure the results are well solved. also allow use to select ONLY more than one files (in the filter option)

Prompt 21

but why is the code taking so long

Again, the algorithm apparently did not do permutations to look for the words, this third major change now took place.

Prompt 22

make it optimised and faster. please. highly efficient. no lag please

At this point, I accepted the result and this is the final result. Thank you.

Note: I have not included some “silly” intermediate prompts, because:

- Some of them are MacOS specific
- Some are one word requests, of hardly altered result
- Some are pleas to AI, quite unprofessional (and unnecessary?—maybe not) I believe.

Improvements

1. Time and Efficiency - a major issue is that the program can take upto 20s to run
2. Files - the files have to be locally downloaded; the program should, ideally, access them from some cloud. There should be an option to access CWSA from the app without downloading the files.
3. The UI - The UI can be more interactive, almost like the actual PDF
4. Accessing the PDF - One should be able to access the PDF directly (result lines should be highlighted)
5. Mobile Application - We plan to build a stable mobile application that can solve the above issues.

The Program - Reference

You can access the program here:
